

Adding a New Project to AWS

Summary

In order to silo AWS services into individual projects, the following steps will be executed.

Step 1: Create a new root user account

Go to the “AWS Organizations > Accounts” page at <https://us-east-1.console.aws.amazon.com/organizations/v2/home/accounts>.

Create a new root user account with the following details:

- Username: <the name of the project>
- E-Mail: it_department+aws_<name of project>@canallc.com

An example can be seen in the screenshots below.

Add an AWS account

You can add an AWS account to your organization either by creating an account or by inviting an existing AWS account to join your organization.

☒ **Create an AWS account**
Create an AWS account that is added to your organization.

☐ **Invite an existing AWS account**
Send an email request to the owner of the account. If they accept, the account joins the organization.

Create an AWS account

AWS account name

Email address of the account's owner

IAM role name

The management account can use this IAM role to access resources in the member account.

		Root r-u4js
☐		eTHOR 754035388834 it_department@canallc.com
☐		Kurt Eades management account 689967901690 keades@canallc.com
☐		WS2 156147597823 it_department+aws_ws2@canallc.com

Step 2: Login with new root user account

Go to the AWS Login page: <https://console.aws.amazon.com>

Make sure to click the link “Sign in using root user email” (Not an IAM user account).

Sign in as IAM user

Account ID (12 digits) or account alias

IAM user name

Password

☐ Remember this account

Sign in

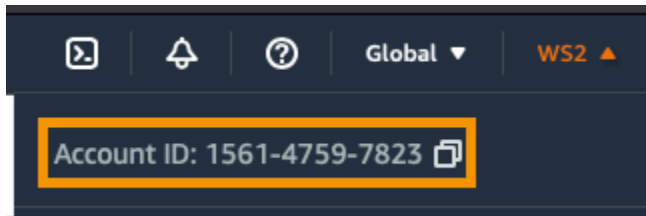

[Sign in using root user email](#)

[Forgot password?](#)

You will need to click “Forgot Password” to get an email from Amazon so you can create the initial password. Once you are logged in, go to the IAM service’s page and create a new IAM user account. Give the new user full admin permissions. From this point forward, the IAM user account will be used for everything, and you will no probably never need to login with the root user account again.

Take note of the root user account’s “Account ID”. You will need it in the next step (and every time you login to manage this project’s resources).

Step 3: Login with the new IAM user account

Go to the AWS Login page: <https://console.aws.com>

Login with the new IAM user account, entering the root user’s “Account ID”.

Sign in as IAM user

Account ID (12 digits) or account alias

156147597823

Root user's
Account ID

IAM user name

dsterrett@canallc.com

IAM user's
email

Password

.....

IAM user's
password

☐ Remember this account

Sign in

Step 4: Manage the project's resources

At this point, you can add AWS services, more IAM users, etc.

Anything added using this login will be siloed under the project's root user account and will not be visible to any other root user accounts.
